# Graphs

## Introduction

### **Graphs - Overview:**

- ▶ Besides arrays, lists and trees the most common data structure (Trees are a special type of graph)
- ▶ Representation of graphs in the computer
- ▶ Breadth-first search (BFS)
- ▶ Depth-first search (DFS)
- ▶ Connected components of a graph

# Graphs

## Introduction

### Terminology:

- ▶ Each graph  $G = (V, E)$  consists of:
  - ▶ A set of vertices (nodes)  $V = \{v_1, v_2, \dots\}$
  - ▶ A set of edges (arcs)  $E = \{e_1, e_2, \dots\}$
- ▶ Each edge connects two vertices ( $u, v \in V$ )
  - ▶ Undirected edge:  $e = \{u, v\}$  (set)
  - ▶ Directed edge:  $e = (u, v)$  (tuple)
- ▶ Self-loops are also possible:  $e = (u, u)$  or  $e = \{u, u\}$

# Graphs

## Introduction

### Weighted graph:

- ▶ Each edge is marked with a real number named **weight**
- ▶ The **weight** is also named **length** or **cost** of the edge depending on the application

# Graphs

## Introduction

**Example:** Road network

- ▶ Intersections: **vertices**
- ▶ Roads: **edges**
- ▶ Travel time: **costs of the edges**

Figure: Map of Freiburg © OpenStreetMap

# Graphs

## Implementation

### How to represent this graph computationally?

1. **Adjacency matrix** with space consumption  $\Theta(|V|^2)$

Figure: Weighted graph with  
 $|V| = 4$ ,  $|E| = 6$

		end-vertex			
		0	1	2	3
start-vertex	0		2		3
	1			9	
	2				-1
	3		7	-2	

Figure: Adjacency matrix

# Graphs

## Implementation

### How to represent this graph computationally?

2. Adjacency list / fields with space consumption  $\Theta(|V| + |E|)$

Each list item stores the **target vertex** and the **cost** of the edge

Figure: Weighted graph with  
 $|V| = 4$ ,  $|E| = 6$

start-vertex	0	1, 2	3, 3
	1	2, 9	
	2	3, -1	
	3	1, 7	2, -2

Figure: Adjacency list

# Graphs

## Implementation

### Graph: Arrangement

- ▶ Graph is fully defined through the [adjacency matrix / list](#)
- ▶ The arrangement is not relevant for visualisation of the graph

Figure: Weighted graph with  
 $|V| = 4$ ,  $|E| = 6$

Figure: Same graph ordered by number -  
outer planar graph

# Graphs

## Implementation - Python

```
class Graph:
    def __init__(self):
        self.vertices = []
        self.edges = []

    def addVertice(self, vert):
        self.vertices.append(vert)

    def addEdge(self, fromVert, toVert, cost):
        self.edges.append( \
            (fromVert, toVert, cost))

    ...
```

# Graphs

## Degrees (Valency)

**Degree of a vertex:** Directed graph:  $G = (V, E)$

Figure: Vertex with in- / outdegree of 3 / 2

- ▶ **Indegree** of a vertex  $u$  is the number of **edge head ends** adjacent to the vertex

$$\deg^+(u) = |\{(v, u) : (v, u) \in E\}|$$

- ▶ **Outdegree** of a vertex  $u$  is the number of **edge tail ends** adjacent to the vertex

$$\deg^-(u) = |\{(u, v) : (u, v) \in E\}|$$

# Graphs

## Degrees (Valency)

**Degree of a vertex:** Undirected graph:  $G = (V, E)$

Figure: Vertex with degree of 4

- **Degree** of a vertex  $u$  is the number of **vertices** adjacent to the vertex

$$\deg(u) = |\{\{v, u\} : \{v, u\} \in E\}|$$

# Graphs

## Paths

**Paths in a graph:**  $G = (V, E)$

Figure: Undirected path of length 3  
 $P = (0, 3, 2, 4)$

Figure: Directed path of length 3  
 $P = (0, 3, 1, 4)$

- ▶ A path of  $G$  is a sequence of edges  $u_1, u_2, \dots, u_i \in V$  with
  - ▶ Undirected graph:  $\{u_1, u_2\}, \{u_2, u_3\}, \dots, \{u_{i-1}, u_i\} \in E$
  - ▶ Directed graph:  $(u_1, u_2), (u_2, u_3), \dots, (u_{i-1}, u_i) \in E$

# Graphs

## Paths

**Paths in a graph:**  $G = (V, E)$

Figure: **Directed path** of length 3  
 $P = (0, 3, 1, 4)$

Figure: **Weighted path** with cost 6  
 $P = (2, 3, 1)$

- ▶ The **length of a path** is: (also costs of a path)
  - ▶ Without weights: **number of edges** taken
  - ▶ With weights: **sum of weights of edges** taken

# Graphs

## Paths

**Shortest path in a graph:**  $G = (V, E)$

Figure: Shortest path from 0 to 2 with cost / distance  $d(0, 2) = ?$

- The shortest path between two vertices  $u, v$  is the path  $P = (u, \dots, v)$  with the shortest length  $d(u, v)$  or lowest costs

# Graphs

## Paths

**Shortest path in a graph:**  $G = (V, E)$

Figure: Shortest path from 0 to 2 with cost / distance  $d(0, 2) = 6$   
 $P = (0, 1, 4, 3, 2)$

- The **shortest path** between two vertices  $u, v$  is the path  $P = (u, \dots, v)$  with the shortest length  $d(u, v)$  or lowest costs

# Graphs

## Paths

**Diameter of a graph:**  $G = (V, E)$

$$d = \max_{u,v \in V} d(u, v)$$

Figure: Diameter of graph is  $d = ?$

- The **diameter** of a graph is the length / the costs of the longest shortest path

# Graphs

## Paths

**Diameter of a graph:**  $G = (V, E)$

$$d = \max_{u,v \in V} d(u, v)$$

Figure: Diameter of graph is  $d = 10$ ,  $P = (3, 2, 5)$

- The diameter of a graph is the length / the costs of the longest shortest path

# Graphs

## Connected Components

**Connected components:**  $G = (V, E)$

Figure: Three connected components

- ▶ Undirected graph:
  - ▶ All connected components are a partition of  $V$

$$V = V_1 \cup \dots \cup V_k$$

- ▶ Two vertices  $u, v$  are in the same connected component if a path between  $u$  and  $v$  exists

# Graphs

## Connected Components

**Connected components:**  $G = (V, E)$

- ▶ Directed graph:
  - ▶ Named **strongly connected components**
  - ▶ Direction of edge has to be regarded
  - ▶ Not part of this lecture

# Graphs

## Connected Components - Graph Exploration

### Graph Exploration: (Informal definition)

- ▶ Let  $G = (V, E)$  be a graph and  $s \in V$  a start vertex
- ▶ We visit each reachable vertex connected to  $s$
- ▶ **Breadth-first search**: in order of the smallest distance to  $s$
- ▶ **Depth-first search**: in order of the largest distance to  $s$
- ▶ Not a problem on its own but is often used as subroutine of other algorithms
  - ▶ Searching of connected components
  - ▶ Flood fill in drawing programmes

# Graphs

## Connected Components - Breadth-First Search

### **Breadth-First Search:**

1. We start with all vertices unmarked and mark visited vertices
2. Mark the start vertex  $s$  (level 0)
3. Mark all unmarked connected vertices (level 1)
4. Mark all unmarked vertices connected to a level 1-vertex (level 2)
5. Iteratively mark reachable vertices for all levels
6. All connected nodes are now marked and in the same connected component as the start vertex  $s$

# Graphs

## Connected Components - Breadth-First Search

- ▶ The marked vertices create a “spanning tree” containing all reachable nodes

Figure: spanning tree of a breadth-first search

# Graphs

## Connected Components - Breadth-First Search

# Graphs

## Connected Components - Breadth-First Search

- ▶ The marked vertices create a “spanning tree” containing all reachable nodes

Figure: spanning tree of a breadth-first search

# Graphs

## Connected Components - Depth-First Search

### Depth-First Search:

1. We start with all vertices unmarked and **mark visited vertices**
2. Mark the start vertex **s**
3. Pick an unmarked **connected vertex** and start a **recursive depth-first search** with the vertex as start vertex  
(continue on step 2)
4. If no unmarked connected vertex exists go one vertex back and continue recursive search  
(reduce the recursion level by one)

# Graphs

## Connected Components - Depth-First Search

### Depth-first search:

- ▶ Search starts with **long paths** (searching with depth)
- ▶ Like **breadth-first search** marks all connected vertices
- ▶ If the graph is acyclic we get a **topological sorting**
  - ▶ Each newly visited vertex gets marked by an increasing number
  - ▶ The numbers increase with path length from the start vertex

# Graphs

## Connected Components - Depth-First Search

Figure: spanning tree of a depth-first search

# Graphs

Why is this called Breadth- and Depth-First Search?

# Graphs

## Connected Components - Breadth-/Depth-First Search

### Runtime complexity:

- ▶ Constant costs for each visited vertex and edge
- ▶ We get a runtime complexity of  $\Theta(|V'| + |E'|)$
- ▶ Let  $V'$  and  $E'$  be the reachable vertices and edges
- ▶ All vertices of  $V'$  are in the same connected component as our start vertex  $s$
- ▶ This can only be improved by a constant factor

# Application example

## Image processing

- ▶ Connected component labeling
- ▶ Counting of objects in an image

# Application example

## Image processing

What is object, what is background?

# Application example

## Image processing

### **Interpret image as graph:**

- ▶ Each white pixel is a node
- ▶ Edges between adjacent pixels (normally 4 or 8 neighbors)
- ▶ Edges are not saved externally, algorithm works directly on array
- ▶ Breadth- / depth-first search find all connected components (particles)

# Application example
