### Algorithms and Data Structures Static Arrays, Dynamic Arrays, Amortized Analysis

Albert-Ludwigs-Universität Freiburg

#### Prof. Dr. Rolf Backofen

Bioinformatics Group / Department of Computer Science Algorithms and Data Structures, December 2017

#### Structure

Static Arrays

Dynamic Arrays Introduction Amortized Analysis

- Static arrays exist in nearly every programming language
- They are initialized with a fixed size *n*
- Problem: The needed size is not always clear at compile time

Table: Static array with size n = 5

#### Python:

- We have dynamic sized lists
- Python does automatic resizing when needed

```
# Creates a list of "0"s with init. size 10
numbers = [0] * 10
# Prints number at index 7 ("0")
print("%d" % numbers[7])
# Saves number 42 at index 8
numbers[8] = 42
# Prints the number at index 8 ("42")
print("%d" % numbers[8])
```

## Static Arrays

UNI FREIBURG

- The name "static array" has nothing to do with the keyword static from Java / C++
- Nor is the array allocated before the program starts
- The size of the array is static and can not be changed after creation
- The name "fixed-size array" would be more appropriate

#### Structure

Static Arrays

Dynamic Arrays Introduction Amortized Analysis

- The array is created with an initial size
- The size can be dynamically modified
- Problem: We need a dynamic structure to store the data

#### Python:

```
greetings = ["Good morning", "ohai"]
greetings.append("Guten morgen")
greetings.append("bonjour")

# Prints text at index 2 ("Guten morgen")
print("%s" % greetings[2])

# Removes all elements
greetings.clear();
```

#### Append:

- Create fixed-size array with the needed size
- Copy elements from the old to the new array

#### Remove:

- Create fixed-size array with the needed size
- Copy elements from the old to the new array

## Dynamic Arrays Implementation 1

First implementation:

- We resize the array before each append
- We choose the size exactly as needed

```
class DynamicArray:
    def __init__(self):
        self.size = 0
        self.elements = []
    def capacity(self):
        return len(self.elements)
```

```
class DynamicArray:
    def append(self, item):
        newElements = [0] * (self.size + 1)
        for i in range(0, self.size):
            newElements[i] = self.elements[i]
        self.elements = newElements
        newElements[self.size] = item
        self.size += 1
```

Why is the runtime quadratic?

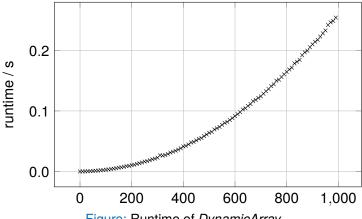

Figure: Runtime of *DynamicArray* 

# Runtime:

1	<i>O</i> (1)	write 1 element
1 2	<i>O</i> (1 + 1)	write 1 element, copy 1 element
123	O(1 + 2)	write 1 element, copy 2 elements
1 2 3 4	<i>O</i> (1 + 3)	write 1 element, copy 3 elements
1 2 3 4 5	<i>O</i> (1 + 4)	write 1 element, copy 4 elements
1 2 3 4 5 6	<i>O</i> (1 + 5)	write 1 element, copy 5 elements
		•••

**Analysis:** 

Implementation 1

- Let T(n) be the runtime of n sequential append operations
- Let  $T_i$  be the runtime of each i-th operation
  - Then  $T_i = A \cdot i$  for a constant A
  - We have to copy i-1 elements

$$T(n) = \sum_{i=1}^{n} T_i = \sum_{i=1}^{n} (A \cdot i) = A \cdot \sum_{i=1}^{n} i = A \cdot \frac{n^2 + n}{2}$$
$$= O(n^2)$$

#### Idea:

- Better resize strategy
- We allocate more space than needed
- We over-allocate a constant amount of elements
  - $\blacksquare$  Amount: C = 3 or C = 100

```
def append(self, item):
    if self.size >= len(self.elements):
        newElements = [0] * (self.size + 100)
        for i in range(0, self.size - 1):
            newElements[i] = self.elements[i]
        self.elements = newElements
    self.elements[self.size] = item
    self.size += 1
```

## Dynamic Arrays

Implementation 2

Why is the runtime still quadratic?

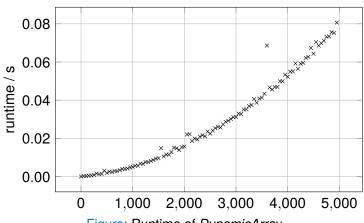

Figure: Runtime of DynamicArray

## Dynamic Arrays

REIBURG

#### Implementation 2

#### **Runtime for** C = 3:

1	<i>O</i> (1)	write 1 element
1 2	<i>O</i> (1)	write 1 element
1 2 3	<i>O</i> (1)	write 1 element
1234	O(1 + 3)	write 1 element, copy 3 elements
1 2 3 4 5	<i>O</i> (1)	write 1 element
1 2 3 4 5 6	<i>O</i> (1)	write 1 element
1234567	O(1 + 6)	write 1 element, copy 6 elements

#### **Analysis:**

- Most of the append operations now just cost O(1)
- Every C steps the costs for copying are added:  $C, 2 \cdot C, 3 \cdot C, ...$  this means:

$$T(n) = \sum_{i=1}^{n} A \cdot 1 + \sum_{i=1}^{n/C} A \cdot i \cdot C$$

$$= A \cdot n + A \cdot C \cdot \sum_{i=1}^{n/C} i$$

$$= A \cdot n + A \cdot C \cdot \frac{\frac{n^2}{C^2} + \frac{n}{C}}{2}$$

$$= A \cdot n + \frac{A}{2 \cdot C} \cdot n^2 + \frac{A}{2} \cdot n = O(n^2)$$

The factor of n<sup>2</sup> is getting smaller

#### Idea:

Double the size of the array

```
def append(self, item):
    if self.size >= len(self.elements):
        newElements = [0] \
             * \max(1, 2 * \text{self.size})
        for i in range(0, self.size):
            newElements[i] = self.elements[i]
        self.elements = newElements
    self.elements[self.size] = item
    self.size += 1
```

Now the runtime is linear with some bumps. Why?

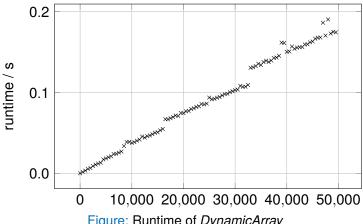

Figure: Runtime of *DynamicArray* 

Implementation 2

#### Runtime for C = 2 (Double the size):

<b>†</b>	<i>O</i> (1)	write 1
	` ,	
1 2	O(1 + 1)	write 1, copy 1 element
1 2 3	O(1 + 2)	write 1, copy 2 elements
1 2 3 4	<i>O</i> (1)	write 1
1 2 3 4 5	O(1 + 4)	write 1, copy 4 elements
1 2 3 4 5 6	<i>O</i> (1)	write 1
1 2 3 4 5 6 7	<i>O</i> (1)	write 1
1 2 3 4 5 6 7 8	<i>O</i> (1)	write 1
1 2 3 4 5 6 7 8 9	O(1 + 8)	write 1, copy 8 elements

#### **Analysis:**

- Now all appends cost O(1)
- Every  $2^i$  steps we have to add the cost  $A \cdot 2^i$  (for i = 0, 1, 2, ..., k with  $k = floor(log_2(n-1))$
- In total that accounts to:

$$T(n) = n \cdot A + A \cdot \sum_{i=0}^{k} 2^{i} = n \cdot A + A(2^{k+1} - 1)$$

$$\leq n \cdot A + A \cdot 2^{(k+1)}$$

$$= n \cdot A + 2 \cdot A \cdot 2^{(k)}$$

$$\leq n \cdot A + 2 \cdot A \cdot n$$

$$= 3 \cdot A \cdot n$$

$$= O(n)$$

#### How do we shrink the array?

- If the array is half-full, we can shrink it by half, like for the append operation
- If we append directly after shrinking we have to extend the array again
  - We leave some space for following append operations
  - $\Rightarrow$  We only shrink the array to 75%

#### Analysis:

- **Difficult:** We have a random number of *append / remove* operations
- We can not exactly predict when resizing is happening

#### Structure

Static Arrays

Dynamic Arrays
Introduction
Amortized Analysis

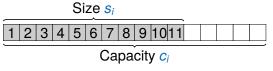

Figure: Static array with capacity  $c_i$ 

#### **Notation:**

- We have *n* instructions  $O = \{O_1, ..., O_n\}$
- The size after operation i is  $s_i$ , with  $s_0 := 0$
- The capacity after operation i is  $c_i$ , with  $c_0 := 0$
- The cost of operation i is  $cost(O_i)$  (previously named  $T_i$ )

Reallocation:  $cost(O_i) \le A \cdot s_i$ , Insert / Delete (Update):  $cost(O_i) \le A$ .

## Dynamic Arrays

Amortized Analysis - Example

Operation		Size s <sub>i</sub>	Capactity c <sub>i</sub>	Costs $cost(O_i)$	
<i>O</i> <sub>1</sub>	append	realloc.	$s_1$	<i>C</i> <sub>1</sub>	$A \cdot s_1$
$O_2$	append		$s_2$	$c_2 = c_1$	<i>A</i> · 1
$O_3$	append		$s_3$	$c_3 = c_1$	<i>A</i> · 1
$O_4$	remove		$s_4$	$c_4 = c_1$	<i>A</i> ⋅ 1
<i>O</i> <sub>5</sub>	remove	realloc.	<i>s</i> <sub>5</sub>	<i>c</i> <sub>5</sub>	$A \cdot s_5$
$O_6$	append		$s_6$	$c_6 = c_5$	<i>A</i> · 1
$O_7$	remove		$s_7$	$c_7 = c_5$	<i>A</i> · 1
<i>O</i> <sub>8</sub>	append		<i>s</i> <sub>8</sub>	$c_8 = c_5$	<i>A</i> ⋅ 1
<i>O</i> <sub>9</sub>	append	realloc.	$s_9$	<b>c</b> <sub>9</sub>	$A \cdot s_9$
$O_n$	append		$s_n$	Cn	<i>A</i> ⋅ 1

#### Implementation:

■ If  $O_i$  is an append operation and  $s_{i-1} = c_{i-1}$ :

$$\Rightarrow$$
 Resize array to  $c_i = \left\lfloor \frac{3}{2}s_i \right\rfloor = \text{floor}\left(\frac{3}{2}s_i\right)$ 

$$\Rightarrow cost(O_i) = A \cdot s_i$$

$$S_{i-1} = 7$$

$$S_{i} = S_{i-1} + 1 = 8$$

$$1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7$$

$$C_{i-1} = S_{i-1} = 7$$

$$\Rightarrow 12 = C_{i} = \lfloor \frac{3}{2}S_{i} \rfloor = 8$$

Figure: Append operation with reallocation

**Result:** after operation we have  $c_i = \frac{3}{2} \cdot s_i$ 

#### Implementation:

■ If  $O_i$  is an *remove* operation and  $s_{i-1} \leq \frac{1}{3}c_{i-1}$ :

⇒ Resize array to 
$$c_i = \left\lfloor \frac{3}{2}s_i \right\rfloor = \text{floor}\left(\frac{3}{2}s_i\right)$$
  
⇒  $cost(O_i) = A \cdot s_i$ 

$$\begin{array}{c|c}
s_{i-1} = 5 \\
\hline
1 & 2 & 3 & 4 & 5
\end{array}$$

$$c_{i-1} = 15 > 3 \cdot s_{i-1}$$

$$\Rightarrow \begin{array}{c|c}
s_i = s_{i-1} - 1 \\
\hline
1 & 2 & 3 & 4 \\
\hline
6 = c_i = \frac{3}{2}s_i = 4$$

Figure: Remove operation with reallocation

**Result:** after operation we have again  $c_i = \frac{3}{2} \cdot s_i$ 

### Idea for proof:

- Expensive are only operations where reallocations are necessary
- If we just reallocated, it takes some time until the next reallocation is required.
- **Assumption:** After a costly *reallocation* of size X we have at least X operations of runtime O(1)
- **Then:** Total cost of n operations is maximally  $2 \cdot n$

Table: Dynamic Array with  $C_{\text{ext}} = \frac{3}{2}$ 

Operation		Size	Capacity	Costs	
Operation		Si	$C_i$	$cost(O_i)$	
<i>O</i> <sub>1</sub>	арр.	realloc.	<i>s</i> <sub>1</sub>	$c_1 = 4$	$C_1 \cdot s_1$
$O_2$	арр.		$s_2$	$c_2 = c_1$	$C_2$
$O_3$	арр.		$s_3$	$c_3 = c_1$	$C_2$
$O_4$	арр.		$s_4$	$c_4 = c_1$	$C_2$
<i>O</i> <sub>5</sub>	арр.	realloc.	<b>s</b> <sub>5</sub>	$c_5 = \lfloor \frac{3}{2}s_5 \rfloor = 7$	$C_1 \cdot s_5$
$O_6$	арр.		$s_6$	$c_6 = c_5$	$C_2$
$O_7$	арр.		s <sub>7</sub>	$c_7 = c_5$	$C_2$
<i>O</i> <sub>8</sub>	арр.	realloc.	<i>s</i> <sub>8</sub>	$c_8 = \frac{3}{2}s_8 = 12$	$C_1 \cdot s_8$
		•••			

$$\begin{cases} \text{distance} \\ 4 \ge \left\lfloor \frac{s_1}{2} \right\rfloor \end{cases}$$

distance

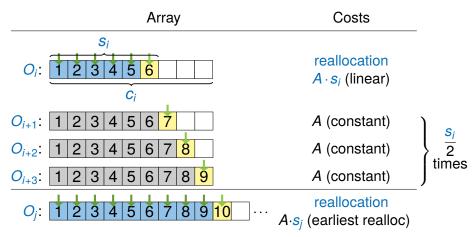

$$3 \ge \left| \frac{s_5}{2} \right|$$

#### To show:

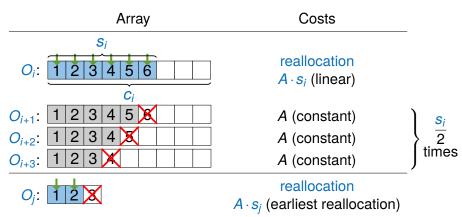

- **Lemma:** If a *reallocation* occurs at  $O_i$  the nearest reallocation is at  $O_j$  with  $j i > \frac{s_i}{2}$
- Corollary:  $cost(O_1) + \cdots + cost(O_n) \le 4A \cdot n$

Table: Case 1:  $\frac{1}{2}s_i$  appends

#### **Proof of lemma:**

- If a reallocation happens at  $O_i$  and then again at  $O_j$ , then  $j-i \ge s_j/2$
- $\blacksquare$  After operation  $O_i$  the capacity is

$$c_i = \left\lfloor \frac{3}{2} \cdot s_i \right\rfloor$$

- Lets consider a operation  $O_i$  to  $O_k$  with  $k-i \le \frac{S_i}{2}$ :
  - Case 1: Since the *reallocation* we have inserted at maximum floor  $\left(\frac{1}{2} \cdot s_i\right)$  elementsation

$$s_k \le s_i + \left| \frac{s_i}{2} \right| = \left| \frac{3}{2} s_i \right| = c_i$$
 no reallocation needed

#### Proof of lemma - continued:

■ Case 2: Since the *reallocation* we have removed at maximum  $\left|\frac{1}{2}s_i\right|$  elements

$$s_{k} \geq s_{i} - \left\lfloor \frac{s_{i}}{2} \right\rfloor = \left\lceil \frac{1}{2} s_{i} \right\rceil$$

$$\Rightarrow 3 \cdot s_{k} \geq \left\lceil \frac{3}{2} s_{i} \right\rceil \geq \left\lceil \frac{3}{2} s_{i} \right\rceil = c_{i}$$

no reallocation needed

$$cost(O_1) + \cdots + cost(O_n) \le 4A \cdot n$$

- Let the *reallocations* be at operations  $cost(O_{i_1}), ..., cost(O_{i_m})$
- The cost of all *reallocations* are  $A \cdot (s_{i_1} + \cdots + s_{i_m})$
- With the lemma we know:

$$i_2 - i_1 > \frac{s_{i_1}}{2}, \quad i_3 - i_2 > \frac{s_{i_2}}{2}, \quad \dots, \quad i_m - i_{m-1} > \frac{s_{i_{m-1}}}{2}$$

#### ■ We can conclude that:

$$i_{2}-i_{1}>rac{s_{i_{1}}}{2} \qquad \Rightarrow \qquad s_{i_{1}}<2(i_{2}-i_{1}) \ i_{3}-i_{2}>rac{s_{i_{2}}}{2} \qquad \Rightarrow \qquad s_{i-2}<2(i_{3}-i_{2}) \ dots \ i_{m}-i_{m-1}>rac{s_{i_{m-1}}}{2} \qquad \Rightarrow \qquad s_{i_{m-1}}<2(i_{m}-i_{m-1}) \ s_{i_{m}}\leq n \qquad (trivial)$$

■ The costs of all reallocations are:

$$\begin{aligned} cost(realloc.) &= A \cdot \left( s_{i_1} + \dots + s_{i_m} \right) \\ &< A \cdot \left( 2(i_2 - i_1) + 2(i_3 - i_2) + \dots + 2(i_m - i_{m-1}) + n \right) \\ &= A \cdot \left( 2(i_m - i_1) + n \right) \\ &\leq A \cdot (2n + n) = 3A \cdot n \end{aligned}$$

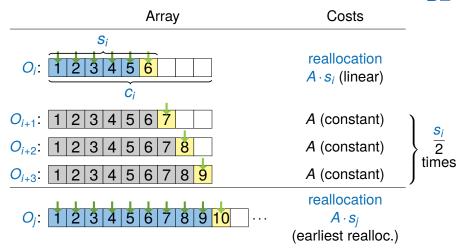

Additionally we have to consider the respective constant costs for a normal append or remove  $(\leq A \cdot n)$  therefore in total  $\leq 4 \cdot A \cdot n$ 

## Dynamic Arrays

Amortized Analysis - Alternate Proof of Corollary

Table: Case 1:  $\frac{1}{2}s_i$  appends

- Total costs of  $A \cdot \frac{3}{2} \cdot s_i$  for  $\frac{s_i}{2} + 1$  operations
- Cost per operation:

$$\frac{\frac{3}{2}A \cdot s_i}{\frac{1}{2}s_i + 1} \le \frac{\frac{3}{2}A \cdot s_i}{\frac{1}{2}s_i} = 3 \cdot A = \text{const.}$$

# Dynamic Arrays

#### Amortized Analysis - Alternate Proof of Corollary

Array	Costs	
O <sub>i</sub> : 123456	reallocation $A \cdot s_i$ (linear)	
$O_{i+1}$ : 1 2 3 4 5 $\times$ $O_{i+2}$ : 1 2 3 4 $\times$ $O_{i+3}$ : 1 2 3 $\times$ $O_{i+3}$	<ul><li>A (constant)</li><li>A (constant)</li><li>A (constant)</li></ul>	$\begin{cases} \frac{s_i}{2} \\ \text{times} \end{cases}$
O <sub>j</sub> : 12 X	reallocation $A \cdot s_j$ (linear)	

- Runtime analysis for local worst-case sequence
- Same total cost as previous slide

### Bank account paradigm:

- Idea: "Save first, spend later"
- For each operation we deposit some coins on an "bank account"
  - ⇒ We still have constant costs
- When we have a linear operation (reallocation) we pay with the coins from our "bank account"
- For the "double the size" strategy we have to pay two coins per operation

Double the size:	$cost(O_i)$	deposit / withdraw	account value
<u>†</u>	<i>O</i> (1)	+2	2
1 2	O(1 + 1)	+2 -1	3
123	O(1 + 2)	+2 -2	3
1234	<i>O</i> (1)	+2	5
1 2 3 4 5	O(1 + 4)	+2 -4	3
1 2 3 4 5 6	<i>O</i> (1)	+2	5
1 2 3 4 5 6 7	<i>O</i> (1)	+2	7
12345678	<i>O</i> (1)	+2	9
1 2 3 4 5 6 7 8 9	O(1 + 8)	+2 -8	3

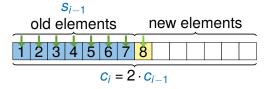

Figure: Array after realloc. (insert) operation

### Why do we need to deposit 2 coints per operation?

- Each newly inserted element has to be copied later (first coin)
- Due to the factor of two there is for each new element also an old one in the array that also has to be copied (second coin)

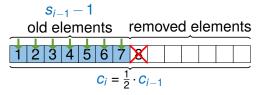

Figure: Array after realloc. (remove) operation

### Shrinking strategy: If array 1/4 full shrink by half

- How many coins do we need per remove operation?
- **Worst case:** The previous remove operation triggered a *reallocation*
- ⇒ Array is half full

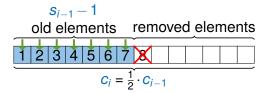

Figure: Array after realloc. (remove) operation

### Shrinking strategy: If array 1/4 full shrink by half

- Array is half full
- The nearest *reallocation* is after removing  $\frac{1}{4}c_i$  elements
- We have to copy  $\frac{1}{4}c_i$  elements
- $\Rightarrow$  1 coin per operation is enough
